                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Conservative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XLIO-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of plasmid R1. The vector was ligated this derivative of plasmid R1. The vector was ligated with agarded the contractive of plasmid R1. The vector was ligated with agarded the contractive of plasmid R1. The vector was ligated with agarded the contractive of plasmid R1. The vector was ligated with agarded the contractive of plasmid R1. The vector was ligated with agarded the contractive of plasmid R1.

The 2 week old seedlings were salt stressed in a solution of 500mM NaCl for 3 days prior to harvesting. Complementary DNA was synthesized from mRNA using a primer consisting of a poly(dT) sequence with a XhoI restriction site. EcoRI adapters were ligated to the blunt-ended cDNA fragments followed by XhoI digestion. The CDNA fragments were directionally cloned into the EcoRI-XhoI restriction site of the pBluescript vector. The ligated cDNA fragments were transformed into DH10B host cells (GibcoBRL). This library
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            old

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gi|4732114|gb|AFT29072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored me DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampiallin resistance."
      0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor Oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to
into the Not I and Ec (Pharmacia). Library

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence represents a directional desoxynucleotide building block, which was used to construct chimeric promoters of the invention. The specification describes chimeric expression promoters. These chimeric promoters comprise a nucleic acid sequence which is derived from a first plant promoter, in which a plant vascular expression promoter region is replaced with a nucleic acid sequence derived from a second plant promoter comprising a plant green tissue expression promoter region. Preferably, the first plant promoter originates from commelina yellow mottle virus, and the second plant promoter originates from the Cassava vein mosaic virus. Especially, the promoters are derived from intergenic regions. The chimeric promoters are useful for producing transcenic regions.
 The present sequence represents the directional building block S7, which is used to construct chimeric promoters of the invention in PCR reactions. The specification describes a chimeric expression promoter comprising a petE promoter of the pea plastocyanin gene,
                                                                                                         Chimeric expression promoter for producing dicotyledonous and monocotyledonous transgenic plants comprises a nucleic acid suderived from a promoter of the pea plastocyanin gene -
                                                                                                                                                                           WPI; 2000-587667/55.

                         promoter is derived from the petE promoter from pea plastocyanin gene, by fusing the petE as-1 like and nos enhancer like elements to the promoter MPr1098 (comprising TATA and CAAT boxes of petE), and then fusing a fragment comprising a duplication of the element as2 and as1. The petE promoter directs cell-specific but not full light-regulated expression in transgenic tobacco plants. The promoter is used to construct chimeric promoters of the invention. The specification describes a chimeric expression promoter comprising a promoter of the pea plastocyanin gene, or comprising a Box operably or functionally linked upstream of a CAAT box, TATA box and transcription initiation site. The chimeric promoters are used in expression vectors for producing transgenic plants, such as dicotyledonous species, e.g. potato, tobacco, cotton, lettuce, tomato, melon, cucumber, pea, wheat
rape, be barley,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    comprising a G box operably or functionally linked upstream of a CAAT box, TATA box and transcription initiation site. The chimeric promoters are used in expression vectors for producing transgenic plants, such as dicotyledonous species, e.g. potato, tobacco, cotton lettuce, tomato, melon, cucumber, pea, rape, beetroot, or sunflower, and monocotyledonous species, e.g. wheat, barley, oat, rice, or corn
                                                                                                                                                                                                                                                                                             Chimeric expression promoter for producing dicotyledonous monocotyledonous transgenic plants comprises a nucleic aci derived from a promoter of the pea plastocyanin gene -
                                                                                                                                                                                                                                  The present sequence represents the chimeric promoter Mpr1112. The

                                                                                      promoter is used to construct chimeric promoters of the invention. The specification describes a chimeric expression promoter comprising a gromoter of the pea plastocyanin gene, or comprising a G box operably or functionally linked upstream of a CAAT box. TATA box and transcription initiation site. The chimeric promoters are used in expression vectors for producing transgenic plants, such as dicotyledonous species, e.g. potato, tobacco, cotton, lettuce, tomato, melon, cucumber, pea,
                                                                                                                                                                                    The present sequence represents the chimeric promoter Mprilli. The promoter is derived from the petE promoter from pea plastocyanin gene, by fusing the petE as-1 like and nos enhancer like elements to the promoter Mprilose (comprising TATA and CAAT boxes of petE), and then inserting a G box and fusing a fragment comprising a duplication of the element as2 and as1. The petE promoter directs cell-specific but not full light-regulated expression in transgenic tobacco plants. The
                                                                                                                                                                                                                                                                                                                      Chimeric expression promoter for producing dicotyledonous monocotyledonous transgenic plants comprises a nucleic aci derived from a promoter of the pea plastocyanin gene -
                                                                                                                                                                                                                                                                                                                                                                                                       Rance I,

                                                                                           Matches
                                                                                                                      Query Match
                                                                                                                                                                                            The specification describes chimeric expression promoters. These chimeric promoters comprise a nucleic acid sequence which is derived from a first plant promoter, in which a plant vascular expression promoter region is replaced with a nucleic acid sequence derived from a second plant promoter comprising a plant green tissue expression promoter region. Preferably, the first plant promoter originates from Commelina yellow mottle virus, and the second plant promoter originates from the Cassava vein mosaic virus. Especially, the promoters are derived from intergenic regions. The chimeric promoters are useful
                                                                                                                                                                                                                                                                                                                                                                                                               Chimeric expression promoter for transgenic plant production, comprises sequence from promoter comprising vascular expression region replaced with sequence from promoter comprising green tissue expression region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Chimeric - Commelina yellow mot

                                                                                                                                                                                                                  The present sequence represents a chimeric promoter of the invention. The specification describes chimeric expression promoters. These chimeric promoters comprise a nucleic acid sequence which is derived from a first plant promoter, in which a plant vascular expression promoter region is replaced with a nucleic acid sequence derived from a second plant promoter comprising a plant green tissue expression promoter region. Preferably, the first plant promoter originates from Commelina yellow mottle virus, and the second plant promoter originates from the Cassava vein mosaic virus. Especially, the promoters are derived from intergenic regions. The chimeric promoters are useful
                                                                                                                                                                                                                                                                                                                                                                         Chimeric expression promoter for transgenic plant production, compris sequence from promoter comprising vascular expression region replaced with sequence from promoter comprising green tissue expression region

These chimeric promoters comprise a nucleic acid sequence which is derived from a first plant promoter, in which a plant vascular expression promoter region is replaced with a nucleic acid sequence derived from a second plant promoter comprising a plant green tissue expression promoter region. Preferably, the first plant promoter originates from Commelina yellow mottle virus, and the second plant promoter originates from the Cassava vein mosaic virus. Especially, the promoters are derived from intergenic regions. The chimeric promoters are useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Chimeric expression promoter for transgenic plant production, compris sequence from promoter comprising vascular expression region replaced with sequence from promoter comprising green tissue expression region

Preferably, the first plant promoter originates from Commelina yellow mottle virus, and the second plant promoter originates from the Cassava vein mosaic virus. Especially, the promoters are derived from intergenic regions. The chimeric promoters are useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Chimeric expression promoter for transgenic plant production, compris-

These chimeric promoters comprise a nucleic acid sequence which is derived from a first plant promoter, in which a plant vascular expression promoter region is replaced with a nucleic acid sequence derived from a second plant promoter comprising a plant green tissue expression promoter region. Preferably, the first plant promoter originates from commelina yellow mottle virus, and the second plant promoter originates from the Cassava vein mosaic virus. Especially, the promoters are derived from intergenic regions. The chimeric promoters are useful for producing transgenic plants.
                                                                                                                                                                                                                                                                                             Promoter; intergenic region; Commelina yellow mottle virus; chimeric expression promoter; plant vascular expression promoter; plant green tissue expression promoter; Cassava vein mosaic virus;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Chimeric expression promoter for transgenic plant production, c sequence from promoter comprising vascular expression region re with sequence from promoter comprising green tissue expression

These chimeric promoters comprise a nucleic acid sequence which is derived from a first plant promoter, in which a plant vascular expression promoter region is replaced with a nucleic acid sequence derived from a second plant promoter comprising a plant green tissue expression promoter region. Preferably, the first plant promoter originates from Commelina yellow mottle virus, and the second plant promoter originates from the Cassava vein mosaic virus. Especially, the promoters are derived from intergenic regions. The chimeric promoters are useful

                                                                                                           The specification describes chimeric expression promoters. These chimeric promoters comprise a nucleic acid sequence which is derived from a first plant promoter, in which a plant vascular expression promoter region is replaced with a nucleic acid sequence derived from a second plant promoter comprising a plant green tissue expression promoter region. Preferably, the first plant promoter originates from Commelina yellow mottle virus, and the second plant promoter originates from the Cassava vein mosaic virus. Especially, the promoters are derived from intergenic regions. The chimeric promoters are useful
                                                                                                                                                                                                                                                                                                                                             Chimeric expression promoter for transgenic plant production, compris sequence from promoter comprising vascular expression region replaced with sequence from promoter comprising green tissue expression region

These chimeric promoters comprise a nucleic acid sequence which is derived from a first plant promoter; in which a plant vascular expression promoter region is replaced with a nucleic acid sequence derived from a second plant promoter comprising a plant green tissue expression a second plant promoter comprising a plant green tissue expression promoter region. Preferably, the first plant promoter originates from Commelina yellow mottle virus, and the second plant promoter originate from the Cassava vein mosaic virus. Especially, the promoters are derived from intergenic regions. The chimeric promoters are useful
The patent discloses chimeric expression promoters comprising nucleic acid sequences derived from the promoters of genes encoding high molecular weight wheat glutenin proteins. The chimeric promoters are used in standard recombinant DNA techniques for the generation of transgenic plants and the production of polypeptides (e.g. marker and therapeutic polypeptides).

The present DNA sequence is a PCR primer comprising the cauliflower mosaic virus (CaMV) 35S promoter as-2 motifs (in duplicate) and as-1 motif, used in the construction of the wheat high molecular weight
                                                                                                                                                                   Chimeric expression promoters comprising nucleic acids from genes encoding a high molecular weight wheat glutenin proteins, useful in the production of transgenic plants -
                                                                                                                                                                                                                                                                                                                                                                                                                                         Cauliflower

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 glutenin
plasmids
                                                  and therapeutic party in the present DNA sequence is MPr1133 promoter which is derived by The present DNA sequence is MPr1133 promoter which is derived by deleting the sequence (comprising 2 prolamine-like boxes, 2 GATA boxe G-box and activating element) located upstream of the nucleotide -197 of MPr1130 promoter (AAD03394). The MPr1130 promoter is derived from wheat high molecular weight glutenin PrHWWG-DX5 promoter DNA (AAD03394) wheat high molecular weight glutenin PrHWWG-DX5 promoter DNA (AAD03394).
                     Note: The
                                                                                                                                                                                                                           The patent discloses chimeric expression promoters comprising nucleic acid sequences derived from the promoters of genes encoding high molecular weight wheat glutenin proteins. The chimeric promoters are used in standard recombinant DNA techniques for the generation of transgenic plants and the production of polypeptides (e.g. marker
                                                                                                                                                                                                                                                                                                                                                                                                                Chimeric expression promoters comprising nucleic acids encoding a high molecular weight wheat glutenin proteir production of transgenic plants -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gruber V,

                      The patent discloses chimeric expression promoters comprising nucleic acid sequences derived from the promoters of genes encoding high molecular weight wheat glutenin proteins. The chimeric promoters are used in standard recombinant DNA techniques for the generation of transgenic plants and the production of polypeptides (e.g. marker and therapeutic polypeptides).

The present DNA sequence is MPr1134 promoter which is derived by deleting the sequence (comprising 2 prolamine-like boxes, 2 GATA boxes and G-like box) located upstream of the nucleotide -260 of MPr1130 promoter (AADO3394). The MPR1130 promoter is derived from wheat high molecular weight glutenin PrHMWG-Dx5 promoter DNA (AADO3390) and contains elements from the cauliflower mosaic virus (CaMV) 35S
                                                                                                                                                                                                                                            Chimeric expression promoters comprising nucleic acids from genes encoding a high molecular weight wheat glutenin proteins, useful in the production of transgenic plants -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 236 BP; 64 A; 70 C; 40 G; 62 T; 0 other;
